Figure 2: Non-Smart Proxy Trust Verification

[In this case, the proxy must be an instance of ProxyTrust. Create a "derivative bootstrap proxy" from proxy.]

isTrustedObject(derivativeProxy)

[If false, return; otherwise, continue below.]

isTrustedObject(proxy, context)

[If false, return; otherwise, continue below.]

getProxyVerifier()

getProxyVerifier()

getProxyVerifier()

isTrustedObject(proxy, context)

true

true

Actions vary depending on the TrustVerifier implementation.

Bootstrap and main remote object can be a single, combined object.
